

Version 2 — Cleaned Contextual Notes

Recording: AUDIO-2026-05-20-12-42-45.m4a

Prepared by: Manus AI

Scope of this version: This version focuses only on the business discussion and excludes non-relevant side conversation, searching delays, joking, repeated “okay” exchanges, and casual remarks. The discussion centered on three functional areas: preventing improper candidate reactivation after a **Do Not Proceed** decision, enabling CRD entry for home-office users, and reviewing an example of an incorrect document upload.

Executive Summary

The call focused primarily on a needed Salesforce/EPM control to prevent recruiters or Geo Offices from reactivating a candidate record when a prior NYL association task already resulted in a **Do Not Proceed** decision. The business issue is that a candidate may previously have been associated with New York Life through an agent contract, marketer code, employee relationship, or similar prior identifier. When such a person is reviewed and determined not eligible for a new marketer ID or new agent code, they should not be restarted through EPM as a new candidate. Instead, they should be directed through the appropriate reinstatement or ACS-based process.

The proposed future behavior is that when a user selects the **Reactivate** button in Salesforce/Sales Central, the system should check whether there is a prior NYL association task with a **Do Not Proceed** action. If such a record exists, Salesforce should reject or block the reactivation and display a clear prompt to the user. The prompt should be simple enough for recruiters to understand and should direct them to field service staff for guidance.

A secondary topic addressed a separate user story for CRD handling. The group observed that if a CRD already exists, it appears editable, but if the CRD is missing, the field is grayed out. The proposed requirement is to enable the field so the appropriate home-office team can enter the CRD when one does not already exist.

A third topic involved a real example of an incorrect document upload. The team found a case where a document titled **W4-2026** appeared to contain an incorrect item, specifically an IR-related document under the wrong document title or category. The example appeared current, with a report date around 5/19, and was considered useful evidence to pass to the team.

Topic 1 — Prior NYL Association and Do Not Proceed Reactivation Block

The current onboarding process runs a candidate's Social Security number against internal marketer or NYL association data to determine whether the candidate has been associated with New York Life before. If the system gets a hit, it opens a **Prior NYL Association** task. That task requires review by contracting and home-office teams to determine whether the individual can receive a new marketer ID or whether they must return under a prior contract relationship.

Process Area	Current Understanding from the Call
Trigger	Candidate begins onboarding and provides information that allows the system to check prior association.
Check performed	The candidate's Social Security number is run against prior marketer or NYL association data.
Task created	A Prior NYL Association task opens when the system finds a prior association.
Review group	Contracting and home-office review whether the person can receive a new marketer ID.
Key rule	If the person previously had an agent/contract relationship, they may need to be reinstated under the prior contract rather than issued a new marketer ID.
Current gap	EPM does not yet support reinstatements; the individual may need to be handled through ACS.

The problem occurs when the reviewer takes a **Do Not Proceed** action and the candidate record is inactivated, but the Geo Office later reactivates the same record in Sales Central. This can happen if the candidate stops the recruiting process and then returns months later, or if the Geo Office forgets the earlier determination. The current system allows reactivation even though the prior decision should prevent it.

Required Future Behavior

The group agreed that the system should check for a prior **Do Not Proceed** action before allowing a candidate to be reactivated. If the check finds that a Prior NYL Association task was closed with **Do Not Proceed**, the reactivation should be rejected and the user should receive a Salesforce prompt.

Future Rule	Requirement
Initiation point	The rule should run when the user selects the Reactivate button in Salesforce/Sales Central.
System check	The system should check for a Prior NYL Association task with a Do Not Proceed action.
Decision	If a matching Do Not Proceed record exists, reactivation should be rejected.
User message	The user should receive a clear prompt explaining that the candidate cannot be reactivated.
Next step	The user should be directed to field service staff for guidance.

Proposed Salesforce Prompt Language

The group discussed multiple wording options. They wanted to avoid language that would confuse recruiters, such as overusing terms like marketer ID, agent ID, or code number. They also wanted to keep the message short enough that users would read it and act on it. The preferred direction was to keep the message simple and route the user to field service. A refined version of the agreed language is:

This candidate cannot be reactivated due to a previously active contract with New York Life. Please work with your field service staff for guidance.

The wording may need final review because the group discussed whether the prior association could include a former employee rather than a former agent. The phrase **previously active contract with New York Life** was considered broad enough to avoid excessive detail while still guiding the recruiter correctly.

User Story Draft

User Story Element	Draft Content
As a	Salesforce/Sales Central recruiter or Geo Office user
I want	The system to prevent candidate reactivation when a prior NYL association task has a Do Not Proceed outcome
So that	Candidates who require reinstatement or ACS processing are not incorrectly restarted through EPM as new candidates
Trigger	User selects the Reactivate button on an inactive candidate record
Condition	Candidate has a Prior NYL Association task with Do Not Proceed action
System response	Block or reject reactivation and show a Salesforce prompt
Prompt message	“This candidate cannot be reactivated due to a previously active contract with New York Life. Please work with your field service staff for guidance.”

Acceptance Criteria

ID	Acceptance Criterion
AC-01	When a user selects Reactivate, the system checks whether the candidate has a Prior NYL Association task.
AC-02	If the Prior NYL Association task has a Do Not Proceed action, the system prevents reactivation.
AC-03	If reactivation is prevented, Salesforce displays the approved prompt language.
AC-04	The blocked candidate remains inactive and is not restarted through EPM.

AC-05	The user is directed to field service staff for next-step guidance.
AC-06	If no Do Not Proceed condition exists, the existing reactivation process may continue.
AC-07	The rule should work even if the candidate returns months after the original inactivation.
AC-08	The logic should consider prior marketer code, title, and contract status where available.

Topic 2 — CRD Entry Enablement

A separate topic involved giving Kathleen's team or home-office users the ability to enter a CRD. The observation was that if a CRD value already exists, the field can be edited. However, when the CRD is missing, the field appears grayed out. The group identified this as a separate user story and a simple enablement request.

Current Behavior	Future Requirement
If the CRD already exists, the field appears editable.	Users should continue to be able to edit an existing CRD where permitted.
If the CRD is missing, the field is grayed out.	The field should be enabled so the appropriate home-office user can enter the missing CRD.
Home-office user capability was questioned.	Confirm permissions and enable the intended home-office population to update the record.

A concise user story for this item would be:

As a home-office user, I want to enter a CRD when the CRD field is blank, so that missing CRD information can be completed without relying on a workaround.

Topic 3 — Incorrect Document Upload Example

The group also reviewed a real example of an incorrect document upload. The example involved an EPM ID mentioned during the call and a document titled **W4-2026**. The team observed that one W4-2026 document appeared to be correct, while another document

under the same or similar title appeared to contain an IR-related document. The issue appeared recent, with a report date around 5/19, making it a useful example to share with the team.

Detail	Discussion Point
Example identified	The team found a current example of an incorrect document upload.
EPM ID mentioned	93312 was referenced during the call.
Document title	W4-2026 was discussed as the document title/category.
Observed problem	An IR-related document appeared under the wrong document/document title.
Timing	The example appeared recent, with a report date around 5/19.
Next step	The example will be passed to the team for review.

Action Items

Owner / Group	Action Item	Notes
Business / Product	Finalize Salesforce prompt language for blocked candidate reactivation.	Preferred message should stay short and direct users to field service staff.
Configuration / Development Team	Build the Reactivate-button rule that checks for Prior NYL Association Do Not Proceed.	The check should happen before reactivation is allowed.
Business / Product	Provide screenshot of the Reactivate button and example Prior NYL Association task.	The call referenced screenshots to support the story.
Configuration / Development Team	Enable CRD entry when the CRD field is blank, subject to permission review.	Separate story from the reactivation-blocking requirement.

Business / Operations Team	Share the incorrect document upload example with the team.	The example involved W4-2026 and an IR-related document.
-----------------------------------	--	--

Recommended Workflow Diagram Logic

The future workflow should operate as follows. The user selects **Reactivate** on an inactive candidate record. Salesforce checks for a prior NYL association and reviews the related task outcome. If there is no Do Not Proceed outcome, the normal reactivation flow may continue. If a Do Not Proceed outcome exists, Salesforce blocks reactivation, displays the approved prompt, and directs the user to field service for guidance. This prevents users from incorrectly restarting a candidate who should be handled through reinstatement or ACS.
